On the cover: When cholesterol-enriched, human monocyte-derived macrophages selectively shed cholesterol-microdomains (red) from the plasma membrane into the extracellular matrix. These microdomains have been immunolabeled with a unique mAb that reacts only with organized two-dimensional cholesterol molecule arrays. However, BODIPY-labeled cholesterol (green) does not incorporate into these cholesterol microdomains due to BODIPY's steric hindrance. (See pages 1504–1518.)
